Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CX Chemotkine receptor 4; CXCR-4; lcr-1 gene.

Mus musculus (house mouse)

Mus musculus

Entaryote; Netazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Musinae; Mus

1 (bases 1 to 1422)

Schubel, A., Burgstahler, R. and Lipp, M.

The mouse homologue of the human HIV coreceptor CXCR-4 (FUSIN):

High expression in thymus and lymphoid tissues Lipp, M.

On Nov 15, 2002 this sequence version replaced gi:23269619.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.ngsc.bcm.tmc.edu/projects/rab. Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence

COMMENT

Tue May 18 13:54:41 2004

දු දු contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

Center: Baylor College of Medicine
Center code: BCM
Web site: http://www.hgsc.bcm.tmc.edu/
Contact: hgsc-help@bcm.tmc.edu

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.unc.edu/docs/Genbank draft\_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

40067: contig of 40067 bp in length 40068 40167: gap of unknown length 40168 114660: contig of 74493 bp in length 11461 114761 gap of unknown length 114761 188186: contig of 73426 bp in length 188187 189188; gap of unknown length 188287 190149: contig of 1863 bp in length. Location/Qualifiers

CXCR4-potentiating agents and methods useful for inhibiting neovascularization, and treating solid cancers.

Disclosure; Page 50-51; 63pp; Japanese.

This sequence encodes the mouse CXCR4 protein. The invention relates to remedies inhibiting neovascularisation, remedies for solid cancer, remedies for diseases parhologically caused by neovascularisation and tissue repairing agents containing at a cutive ingredient a substance capable of potentiating CXCR4. Based on a finding that vascularisation is inhibited in a CXCR4 knockout mouse, it becomes possible to prepare infemedies inhibiting vascularisation which contain as the active ingredient a substance capable of potentiating CXCR4, remedies for solid cancer, remedies for diseases pathologically caused by neovascularisation and tissue repairing agents containing as the active ingredient a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    60
                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes a murine CXC chemokine receptor which binds to the mouse CXC chemokine pre-B cell stimulatory factor PBSF/SDF-1. The nucleic acid is isolated from mouse pre-B cell line DW34. The receptor and cells expressing it can be used in the study and mapping of the mechanism of HIV infection and in screening of potential inhibitors of HIV infection and the development of AIDS

The present invention relates to a method for predicting a toxic effect of a compound. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising SEQ ID 1-4225, where differential expression of the gene indicates at least one toxic effect. The method is useful for predicting at least one toxic effect of a compound, predicting an agent that modulates the onset or compound, identifying an agent that modulates the onset or progression of a toxic response, predicting the cellular pathways that a compound modulates in a cell, and identifying an agent that modulates at compound modulates in a cell, and identifying an agent that modulates at compound and identifying an agent that modulates at least one activity of a protein. The method and compositions of the present invention using a database of genes having liver toxin-liduced differential expression, are useful in identifying toxicity markers in liver tissues or cells for drug screening and toxicity assays. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire wipo.int/pub/published_pct_sequences.
                                                                                                                                      GGATGTCGAGAGAGCATTGTGCACAAGTGGATCTCCATCACAGAGGCCCTGGCCTTC 1016
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Predicting a toxic effect of a compound, useful in identifying toxicity warkers in liver tissues or cells for drug screening and toxicity assays, comprises preparing gene expression profile of tissue or cells exposed to the compound.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8 & 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GCCATGGCTGACTGGGTACTTTGGGGAAATTTTTGTGTAAGGCTGTCCATATCATCTACACT 120

This sequence represents CDNA encoding CXC-chemokine receptor-4 (CXCR-4).

Chemokine receptors play an important role in the chemotaxis of T-cells and phagocytic cells to areas of inflammation. CXCR-4 is a member of the cand phagocytic cells to areas of inflammation. CXCR-4 is a member of the CG -protean-coupled receptor family, which is involved in signal transduction, and its ligand is stromal cell derived factor-1 (SDP-1, ANY-2508). CXCR-4 also mediates CD4-independent infection by HIV-1. CXCR-CC ANY-2508). CXCR-4 also mediates CD4-independent infection by HIV-1. CXCR-CC ANY-2508). CXCR-4 also mediates CD4-independent infection by HIV-1. CXCR-CC ANY-2508). CXCR-4 also mediates CD4-independent infection by HIV-1. CXCR-CC ANY-2508). Particularly in brain, breast and colon tumours It was complemented for the continuous proliferation of glioblascence and colon tumours. It was complemented for the continuous proliferation of glioblascena cancer. CC primary brain tumour tissues, breast tumour tissues, colorectal adenocarcinoma, lung carcinoma and melanoma cell lines. CXCR-4 expression was required for the continuous proliferation of glioblascena cancer. CC cells, and inhibition of its gene function resulted in growth arrest. CC proliferation. CXCR-4 and SDP-1 can be used as markers for the diagnosis and prognosis of cell proliferative disorders, and antisense colligonucleotides complementary to at least a portion of an RNA transcript of a cXCR-4 gene can be used to inhibit hyperproliferation of a tumour ccc braventing a disease or disorder involving edel overproliferation of control properties and benign dysproliferation of a tumour ccc brain cancer, propertie cancer and B cell corpusing a disease or disorder involving a deficiency in colligonal disease or disorder involving a deficiency in colligonal disease or disorder involving a deficiency in colligonal disease, Alzheimer's disorder involving a deficiency in coll proliferative disorders and benign dyspercenting or treating a condition where cell proliferation Use of CXCR-4 and SDF-1 as markers for diagnosis and treatment of tumors, degenerative disorders, growth deficiencies, hyper- and hypoproliferative disorders, physical trauma, lesions and wounds. SA,

Identifying a binding compound for cysteine-X-cysteine chemokine receptor (CXCR4) for preventing or treating AIDS and HIV infection, comprises binding a molecule to a molecule with a binding property corresponding to

Example 3; Fig 3A-B; 92pp; English

The present invention describes a method (M1) for identifying a binding compound for cysteine-X-cysteine chemokine receptor 4 (CXCR4) comprises binding a molecule from the library of two or more molecules to the molecule with a binding property corresponding to CXCR4, (M1) comprises:

(a) providing a library of two or more molecules; (b) providing a molecule with a binding property corresponding to CXCR4, (c) binding a molecule from the library of two or more molecules to the molecule with a binding property corresponding to CXCR4, (d) separating the bound compound from the library of two or more molecules; and (e) identifying the bound molecule as a binding compound for CXCR4. Also described is a binding compound (I) for CXCR4 identified from M1. (I) has virucide and contributes. A partially purified CXCR4 protein is useful for carrying out selection, identification and improvement of tight binding ligands in identifying therapeutically useful compounds. Therapeutic CXCR4 binding may be used in the prevention and treatment of AIDS and HIV infection. The present sequence encodes human CXCR4 which is given in an axiangle from the present invention. 8888888888888888888888888

The invention relates to an isolated chemokine receptor 4 (CXCR4) polynucleotide which is useful for studying expression and function of chemokine receptor 4 and for the treatment of virtuess, including HIV-1. Methods associated with chemokine receptor 4 are useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with CXCR4 activity, e.g., human immunodeficiency virus-1 infection. They can validate CXCR4 as a candidate agent for treating a specific condition or disease predicted to be associated with CXCR4 activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with CXCR4 activity. CXCR4 polynucleotides are useful for therapeutic purposes such as to treat HIV-1 infection and also are useful for studying expression of the CXCR4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   291

The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-cegulated in specific cancers (e.g. about 1031 genes up-regulated in caute lymphocytic leukemia). ACC72641 to ACC72860 represent cancer related gene nucleotide sequences which encode the proteins given in CC selection of a pathological cell in a patient; (2) an expression vector comprising a nucleic acid molecule described above; (3) a host cell comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid; (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a cut greening a pathology, e.g. cancer (e.g. cancer of the bone marrow, therefore, brain, breast, cervix, colon/rectum, kidney, lung, ovary, pancreas, prostate, skin and uterus), wounds, ischaemia, heart disease, atherosclerosis and endometriosis. The nucleic acid is also useful in a charactering the patient for identifying agents for treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        411

New gene expression profile generated from primary, endothelial, epithelial, and muscle cell types, useful for identifying disease pathologies involving alterations of gene expression, e.g. cancer.

(ORTH ) ORTHO CLINICAL DIAGNOSTICS INC.

WPI; 2002-740862/80. Wan J, Wang Y;

20-MAR-2002; 2002WO-US008456. 20-MAR-2001; 2001US-0276947P Example 3; Page 827-828; 850pp; English

The invention relates to a gene expression profile comprising one or more genes (ABZ34889-ABZ35692) and generated from a cell type. The cell type is a coronary artery endothelium, umbilical artery or vein endothelium, ocruic endothelium, promothal epithelium, meratinocyte epithelium, monothal epithelium, menal proximal tubule epithelium, prontial epithelium, menal proximal tubule epithelium, prontial epithelium, menal proximal tubule epithelium, prostate cepithelium, umbilical artery smooth muscle, neonatal dermal fibroblast, pulmonary artery smooth muscle, neural progenitor cells, skeletal muscle, astrocytes, cortic smooth muscle, neural progenitor cells, skeletal muscle, astrocytes, cortic smooth muscle, uterine smooth muscle, lung fibroblast, bronchial smooth muscle, uterine smooth muscle, lung fibroblast, cottodermining the level of RNA expression for a sample, determining the level of RNA expression for a sample, determining the phenotype of a cell and distinguishing cell types. The gene or a protein expression profile is useful in identifying disease pathologies involving the attentions of gene expression with respect to tumour type and stage, treatment methods, and prognosis. The gene or protein expression profile may also be used for creating microarray. The microarray is useful for genetic and physical mapping of organisms, confirming cell or tissue medical diagnosis, genetodia, sender or protein expression profile.

σ

The invention relates to a combination which, comprises a number of polynucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of target polynucleotides. The microarray is particularly useful in the diagnostics and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, of corensics and paramacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic applications. The carray can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose various diseases including cancer e.g. adenocarcinoma and larkaemia, immunopathies e.g. AlDS and asthma, neuropathies e.g. Alzheimer's disease and Parkinson's disease. The present sequence represents a polynucleotide form part of the printed specification but was obtained in electronic format directly from USPTO at m17DocID=06500938B1 Combination of polynucleotide probes, useful as array elements in microarray for monitoring the expression of a number of target polynucleotides. 480 540 600 999 901 721 781 841 The present novel sequence represents the human RM3 cDNA isolated from a human macrophage cDNA library. The invention claims for the full length V28 genomic DNA sequence (AAV18343) isolated from a human placenta genomic library. The V28 (AAW4872) and RM3 proteins are seven transmembrane (7TM) receptors which are probably involved in signal transduction. The invention also claims that cells transformed with V28 DNA encoding V28 seven transmembrane receptor polypeptide - useful for producing recombinant polypeptide and anti-V28 antibodies, and in screening assays for V28 agonists and antagonists. DNA can be used to produce the recombinant polypeptide, to produce anti-
V28 antibodies or in screening assays for V28 agonists or antagonists. The antibodies, agonists and antagonists could then be used to modulate V28 receptor-ligand binding, for e.g. in immunological and/or inflammatory events in vivo
                                                                                                                                                                                                                                                                                                                                                           AGCCAGGGGACATCAGTCAGGGGGATGACAGGTACATCTGTGACCGCCTTTACCCCGAT

The invention relates to a purified and isolated R2 seven transmembrane (7TM) receptor. Also included are an anti-R2 antibody, a hybridoma producing the antibody, anigenic peptide fragments of R2, an antiserum producing the antibody, anigenic peptide fragments of R2, an antiserum produced by immunising a mammal with a composition comprising R2 or its fragment, where the fragment comprises at least one R2 extracellular or intracellular domain, and obtaining antiserum from the mammal after the immunishing step, where the antiserum contains antibodies that bind to the R2 7TM receptor, a polymucleotide encoding 7TM receptor R2 and a host cell stably transformed or transfected with the polymucleotide allowing the expression of R2 in the host cell. The antibody is useful for modulating ligand/antiligand binding of a R2 7TM receptor, especially conducting ligand/active binding reactions involved in immunological and/or inflammatory events in vivo. R2 is useful for producing antibodies. The antibodies for juminisation to generate anti-idiotypic antibodies. For purifying R2 polypeptides, for identifying cells producing the polypeptides on their surfaces and for the detection and quantification of 7TM receptors on cell surfaces and in fluids. The

polynucleotide is useful in DNA/RNA hybridisation assays to detect the capacity of cells to synthesies a TTM receptor. The host cell is useful for large scale production of TTM receptors, and in assays for identifying antagonist or agonists of TTM receptor binding. Other TTM receptors isolated in this study include V31 (located on chromosome 17q12-21.2, associated with familial brest cancer), V28 (Chromosome 3p21-ter, associated with von Hippel-Lindau syndrome, thyroid hormone resistance, small call cancer of the lung and pseudo-Zellweger syndrome), R20 (chromosome 11 pl1-pl3 associated with hypoprothrombinaemia and dysprothrombinaemia), V112 and R12. The present sequence is a polymucleotide encoding a 7TM receptor of the invention
                                                                                                                                                                                                                                                                                                      446
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1031

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a new polypeptide capable of binding to a nucleic acid comprising a receptor nucleotide sequence which can function as a receptor for virus infection or is involved in an immune response. The molecules of the invention are useful in the treatment or prevention of a disease caused by a virus or of a disease associated with an infunction of a disease caused by a virus or of a disease associated with an infunction of a disease caused by a virus or of a disease. The zinc finger polypeptide or a nucleic acid encoding such a polypeptide can be used to modulate transcription of a receptor nucleotide sequence. The nucleic acid encoding as a receptor for infection by the virus or is involved in an erceptor nucleotide sequence, where the receptor is capable of functioning as a receptor for infection by the virus or is involved in an immune response, or a nucleic acid encoding such a polypeptide, can be used in the preparation of a medicament for use in the treatment or prevention of a disease caused by a virus or of a disease associated with or caused by malfunction of the receptor as the TNRM receptor, such as autoimmune farbratics or myocardities. The present encephalomyelitie, zheumatoid arthritis or myocardities. The present encephalomyelitie, rheumatoid arthritis or myocardities. The present encephalomyelitie

remedies inhibiting neovascularisation, remedies for solid cancer, remedies for diseases pathologically caused by neovascularisation and tissue repairing agents containing as the active ingredient a substance capable of potentiating CXCR4. Based on a finding that vascularisation is inhibited in a CXCR4 knockcut mouse, it becomes possible to prepare remedies inhibiting vascularisation which contain as the active ingredient a substance capable of potentiating CXCR4, remedies for solid cancer, remedies for diseases pathologically caused by neovascularisation and tissue repairing agents containing as the active ingredient a substance capable of potentiating CXCR4. It is also possible to establish methods for treatment with the use of these remedies

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
